BTU International's WinCon™ Control System Now Supports Barcode Product Traceability

NORTH BILLERICA, Mass., Oct. 3, 2007 — BTU International, Inc. (Nasdaq: BTUI), a leading supplier of advanced thermal processing equipment for the electronics manufacturing and alternative energy markets, today announced the implementation of barcode product traceability in its WinCon™ control system.

WinCon™, BTU's Windows-based control system, now supports barcode, including both handheld and fixed scanners for linear barcode. For automated lines, a barcode scanner can be used to verify that the correct recipe is running on the equipment. If the recipe is incorrect, an alarm will be raised or if the equipment is empty the correct recipe will be loaded. In addition, the barcode scanner can be used with the SMEMA interface and the GEM host.

"The addition of the barcode scanner to the WinCon™ control system allows us to take process control and product traceability to the next level," stated Rob DiMatteo, product manager for BTU's electronics assembly products. "The barcode scanner gives our customers the ability to implement full product traceability without sacrificing throughput or efficiency. This supports our overall commitment to offering the lowest cost of ownership and the best performance."

About BTU International

BTU International is a market-leading, global supplier of advanced thermal processing equipment to the electronics manufacturing and alternative energy generation markets. BTU equipment is used in the production of printed circuit board assemblies and semiconductor packaging as well as in solar cell, nuclear fuel and fuel cell manufacturing. BTU has operations in North Billerica, MA and Shanghai, China with direct sales and service in the USA, Asia and Europe. Information about BTU International is available at www.btu.com.
