Lloyd Doyle Announces a New Installation

February 26, 2007 — Lloyd Doyle Ltd., world leader in the supply of automatic optical test (AOT) and inspection systems for bare printed circuit boards, announces a further installation of their Automatic Optical Test equipment range. Aksion, based in Izhevsk, Russia, has taken delivery of a high-resolution redline system.

redline is a reflective-light based AOT system that provides maximum flexibility to users, allowing them to optically test a variety of PCB substrate/surface combinations. The unique system incorporates a new style of illumination that is suited to contemporary copper clad laminates such as “reverse treated foils” and chemically treated “double-treat” materials. The imaging capabilities of the new system easily cope with these materials in spite of their inherent low contrast.

The unique concept of Automatic Optical Test from Lloyd Doyle combines all the advantages of optical inspection with the logic of electrical test, providing the most versatile defect detection system available for bare PCBs.
