Express Manufacturing Takes Its Traceability to the Next Level with the Inovaxe MODI WES 5

SANTA ANA, CA — April 2026 — Express Manufacturing, Inc. (EMI), a global electronics manufacturing services (EMS) provider, has installed a new Inovaxe MODI WES 5 incoming goods inspection system to improve traceability, streamline receiving processes, and support continued growth in electronics manufacturing.

The MODI WES 5 is an advanced, camera-based incoming inspection platform designed to capture and verify component data at the point of receipt. Using high-resolution imaging and automated data processing, the system reads barcodes, analyzes labels, and records key information to ensure full traceability throughout production. It also integrates with ERP and MES systems, helping manufacturers maintain accurate records from incoming materials through final assembly.

By automating what is traditionally a manual process, the system reduces errors, speeds up receiving, and ensures that only verified materials enter production. The result is improved data accuracy, better inventory control, and greater confidence in downstream manufacturing processes.

“Adding the MODI system gives us a much more controlled and efficient way to handle incoming materials,” said CM Chin, Vice President of Express Manufacturing, Inc. “It helps eliminate guesswork, improves traceability, and supports the level of quality our customers expect.”

Express Manufacturing provides electronics manufacturing services, including PCB assembly, box build, testing, and supply chain support. The company works with customers across industries that require reliable, high-quality production, often under tight timelines and strict quality requirements.

With the addition of the MODI WES 5, EMI is further strengthening its front-end processes—ensuring materials are properly identified, documented, and tracked before they ever reach the production floor. This investment supports more efficient operations, reduces the risk of errors, and enhances overall product quality.

Inovaxe, a leader in material handling and inventory control solutions for electronics manufacturing, partners with MODI to deliver traceability systems that connect incoming inspection with production and storage processes. These solutions are designed to improve efficiency, reduce non-value-added labor, and provide real-time visibility into materials and workflows.

For Express Manufacturing, the new system is another step toward building a more connected and data-driven manufacturing environment.

About Express Manufacturing (EMI)

Founded in 1982, Express Manufacturing, Inc. (EMI) is a global electronics manufacturing services (EMS) provider specializing in high-mix, medium-to-high volume PCB assembly and system integration. With operations in the United States and Asia, EMI supports customers from new product introduction through full production with disciplined program management and supply chain expertise.
