Inside Eastek Malaysia: Organized, Scalable Manufacturing Built on Trust, Stability, and Technical Expertise

Vernon Hills, IL – April 2026 –

Eastek International Corporation continues to strengthen its global manufacturing platform through the sustained performance and expanding capabilities of its Malaysia operation. As customers reassess global manufacturing strategies, Eastek's Malaysia facility has emerged as a preferred location due to its combination of political stability, a mature and reliable supply chain, and a business environment aligned with Western customers' expectations for transparency, quality, and execution discipline.

Located in Alor Setar, Eastek's Malaysia operation is a fully owned, 60,000 sq ft facility designed to support high-mix, low- to medium-volume production with precision and efficiency. The site delivers end-to-end manufacturing services, including PCBA,

prototyping, die attachment, wire bonding, LED module assembly, and full box-build solutions.

Beyond technical capability, Malaysia offers several structural advantages that differentiate it from other near-shore and offshore alternatives. The country provides a politically stable, business-friendly environment with long-standing support for advanced manufacturing and foreign

investment. Its English-proficient, Western-oriented business culture enables clear communication, rapid problem-solving, and effective collaboration across engineering, quality, and program-management teams.

Malaysia's electronics ecosystem is also deep, mature, and highly integrated, with well-established suppliers for components, tooling, test services, and logistics. This stability reduces execution risk, shortens recovery time during supply disruptions, and supports consistent quality outcomes, particularly for complex or technically demanding assemblies. For many customers, this contrasts favorably with regions that are still developing supplier depth or experiencing higher levels of geopolitical or operational volatility.

The facility's structured and highly organized production environment reinforces Eastek's commitment to disciplined processes and repeatable quality. Operating under an ISO 9001 quality management system, the Malaysia team supports complex builds requiring precision, responsiveness, and cross-functional coordination. Its microelectronics expertise – including die attachment and wire bonding – enables Eastek to support advanced applications across multiple industries.

“Our customers rely on us not just for manufacturing capacity, but for predictability and confidence,” said Steve Busch, Vice President of Business Development at Eastek International. “Malaysia provides a stable platform where technical capability, communication, and supply-chain maturity come together. That combination allows us to execute consistently, even in volatile global conditions.”

Strategically positioned in Southeast Asia, Eastek Malaysia provides customers with geographic diversification and enhanced supply-chain resilience while supporting tariff-efficient global manufacturing and diversified trade strategies. This multi-region alignment allows engineering, program management, and production teams to work seamlessly together—supporting new product introductions, dual-source strategies, and long-term scalability.

At the core of Eastek's approach is a commitment to long-term partnerships built on trust, transparency, and proactive communication. From initial design engagement through sustained production, the Malaysia team works closely with customers to anticipate challenges, optimize manufacturability, and deliver consistent, high-quality results.
