Cetec ERP Brings Connected, Full-Suite Manufacturing ERP to electronica 2026

AUSTIN, TX (October 2026) - Cetec ERP, supplier of a web-based ERP platform for manufacturers, will exhibit with CalcuQuote at electronica 2026, taking place November 10-13 at Messe Munich in Munich, Germany. Visitors can meet with the team in Hall C5, Stand 430, to learn how Cetec ERP provides a centralized operational backbone that connects the critical functions of a manufacturing business while integrating with specialized technologies where deeper or broader capabilities are needed.

For electronics manufacturers and EMS providers, managing a complex, high-mix operation requires more than individual software tools. Material planning, purchasing, inventory, production, quality, traceability, accounting and other business processes must remain connected as jobs move from quote to production and ultimately through delivery and financial closeout.

Cetec ERP is designed to provide that underlying structure. Its full-suite architecture brings quoting, purchasing and supply chain, inventory, production, quality and finance together in a single system, providing manufacturers with a common operational foundation and centralized visibility across the business.

At the same time, Cetec ERP is designed to work alongside specialized technologies rather than requiring manufacturers to abandon tools that provide valuable capabilities in specific areas. The platform can serve as the core system of record while connecting with complementary solutions to extend functionality and support the way each manufacturer operates.

“An EMS manufacturer’s technology stack is a lot like a tool belt,” said Scott Ryan, Senior Consultant, Cetec ERP. “Different tools do different jobs, and the value comes from having the right ones accessible when and where you need them. But the belt still has to carry the weight. Cetec ERP provides that foundation across materials, production, quality, and finance, while connecting the specialized systems around it so the business can operate as one whole.”

Cetec ERP provides deep manufacturing functionality out of the box along with practical configuration tools that allow companies to adapt the system to complex, high-mix manufacturing environments. The web-native platform is designed to be implemented, used and continuously developed as a company grows, helping manufacturers build a technology infrastructure that can evolve with their processes and business requirements.

For EMS operations in particular, Cetec ERP provides a centralized foundation across materials and manufacturing operations, helping align people, processes and technology. By bringing material planning, purchasing, inventory, production, quality, traceability and accounting into the same operational framework, manufacturers can reduce disconnected workflows and improve visibility from the shop floor through the back office.

Exhibiting alongside CalcuQuote at electronica 2026 also highlights the value of connecting specialized technologies with a broader operational platform. Rather than treating ERP and purpose-built manufacturing applications as competing approaches, Cetec ERP enables manufacturers to establish a strong core system while integrating the specialized tools that provide additional depth where needed.

“Manufacturers shouldn’t have to choose between an ERP that tries to do everything and a collection of specialized systems that don’t communicate with one another,” Ryan added. “The goal is to have a strong operational core and the flexibility to connect the right specialized technologies around it. That gives manufacturers the structure they need today while leaving room to grow and evolve tomorrow.”

About Cetec ERP

Cetec ERP is a web-based, full-suite manufacturing ERP system designed for small and mid-sized companies. The platform combines CRM, MRP, production management, quality, and accounting in a single system, with a focus on practical implementation, transparent pricing, and long-term usability.
