Green Circuits Strengthens Turnkey Electronics Solutions with Z2Data Supply Chain Intelligence

SAN JOSE, CA — September 2026 — Green Circuits, an electronics manufacturing services (EMS) provider serving OEMs across aerospace and defense, medical, industrial, semiconductor and AI hardware markets, has implemented Z2Data's electronic supply chain intelligence platform to enhance component visibility, strengthen supply chain risk management and provide customers with greater insight throughout the product lifecycle.

The implementation of Z2Data adds an advanced layer of intelligence to Green Circuits' turnkey approach, enabling its team to proactively identify potential component risks related to lifecycle status, availability, obsolescence, compliance and sourcing. With earlier visibility into these factors, Green Circuits can work collaboratively with customers to evaluate options and develop strategies designed to minimize risk and support program continuity.

"Supply chain resiliency is ultimately about being proactive rather than reactive," said Kirk Knudsen, Vice President of Procurement at Green Circuits. "Z2Data gives our team another powerful resource to identify potential component risks earlier and make better-informed decisions. This information allows us to work more strategically with our customers and help them navigate potential challenges before they become larger issues."

Z2Data provides intelligence across electronic components and bills of materials (BOMs), including lifecycle and obsolescence information, sourcing and availability data, supplier intelligence and regulatory compliance. Its platform provides component-level visibility that enables teams to identify potential risks and make informed decisions across the product lifecycle.

For Green Circuits customers, this enhanced visibility supports a more comprehensive turnkey experience. Rather than addressing component concerns only after they arise, Green Circuits can leverage supply chain intelligence to identify potential issues earlier, evaluate alternatives and collaborate with customers on the most appropriate path forward.

"Customers are looking for a partner that can help them manage the entire electronics program, not simply one piece of it," added Knudsen. "Our turnkey model is built around bringing together the capabilities, expertise and information needed to support our customers. Z2Data strengthens that approach by giving us greater visibility into the components that are critical to their programs."

The platform's lifecycle management capabilities can help identify potential end-of-life and obsolescence concerns, while its supply chain intelligence provides insight into factors that can affect component

sourcing and long-term availability. This information gives Green Circuits and its customers additional time to evaluate alternate components, purchasing strategies and other options before a potential issue becomes more difficult to address.

The implementation also reinforces Green Circuits' commitment to using technology and data to deliver a more proactive customer experience. By incorporating component intelligence into its turnkey capabilities, Green Circuits can help customers better understand potential supply chain risks while supporting informed decision-making across engineering, procurement and program management.

In an increasingly complex electronics environment, supply chain challenges can have implications well beyond individual components. Green Circuits' full turnkey approach brings together engineering, sourcing, supply chain management, manufacturing, quality and other critical capabilities to help customers simplify their electronics programs and manage them more effectively.

By combining this end-to-end expertise with Z2Data's advanced component and supply chain intelligence, Green Circuit further strengthens its ability to anticipate challenges, provide actionable insight and deliver comprehensive solutions that meet each customer's needs.
