Transition Automation Introduces Permalex® Tool Kit to Help SMT Manufacturers Maintain Production Readiness

Tyngsboro, MA - September 16, 2026 — Transition Automation, Inc., the leading provider of high-performance metal squeegee blades and holder systems, announces the introduction of its new Permalex® Tool Kit, designed to help busy SMT manufacturing operations keep the critical spare parts and tools needed to maintain their Permalex squeegee systems readily available.

In high-volume electronics manufacturing, even a small missing screw or piece of hardware can create an unnecessary production delay. The Permalex® Tool Kit was developed with this reality in mind, providing SMT managers, process engineers and line operators with a centralized collection of spare screws, hardware and tools associated with mission-critical Permalex squeegee assemblies.

“Large production environments are focused on maximizing uptime, but sometimes it is the smallest component that can create an unexpected disruption,” said Mark Curtin, Technical Support at Transition Automation Inc. “The Permalex Tool Kit gives customers a simple way to keep the essential components they may need right at the line, rather than searching for a missing part when production is already waiting.”

The Permalex Tool Kit is intended for professional SMT operations where equipment availability and process efficiency are critical. By keeping commonly needed components organized and readily accessible, manufacturers can more easily upgrade their Permalex squeegee assemblies without allowing a small missing part to become a larger production issue.

The new kit reflects Transition Automation’s continued focus on supporting customers beyond the initial product purchase with practical solutions designed around the realities of the SMT production floor.

Technology for Improving SMT Print Quality and Production Yield

About Transition Automation

Transition Automation, Inc. is a pioneer in High-Performance Metal Squeegee blades and holder systems. Permalex® brand squeegees are used by many top-tier electronics manufacturers, especially those that supply high-value, mission-critical end markets, such as Space and Satellite, Automotive, Avionics, and Industrial Controls.
